Key Findings & Potential Solutions

Problem Statement

Background:

Digital-First Model: NFX is a professional service business serving diverse geographies and service tiers.
Fluctuating Engagement: The company experiences inconsistent user activity across different locations.
Need for Insights: Management requires a deeper understanding of user behavior patterns post-onboarding.

Business Problem:

Inconsistent Usage: High volume of new user influx is offset by unstable repeat engagement.
Segment Blind Spots: Lack of visibility into which customer groups are truly loyal.
Lifecycle Uncertainty: The typical journey from onboarding to long-term value is not clearly defined.
Attribution Gaps: Difficulty identifying which acquisition channels yield the highest long-term ROI.

Objective:

Cohort Analysis: Perform deep-dive analysis on customer behavior over specific time-bound groups.
Trend Identification: Uncover patterns in retention, engagement, and marketing channel effectiveness.
Strategic Prioritization: Use data to rank customer segments and optimize marketing/product interventions.

Approaches

Analytical Logic (DAX Development)

- Retention Tracking: Developed complex DAX measures for Churn Rate and Retention Curves to visualize the customer lifecycle.
- Reactivation Events: Created custom logic to isolate users returning after a period of inactivity, moving beyond simple acquisition metrics.
- User Segmentation: Built Engagement Buckets (e.g., Power User vs. Regular) to categorize customer value over time.

Strategic Visual Storytelling

- Efficiency Metrics: Visualized Time to First Action to identify friction points in the onboarding process.
- Cohort Mapping: Grouped customers by acquisition month to track behavior decay and long-term loyalty.
- Interactive Insights: Deployed cross-filtering slicers (Geography, Service Tier) to allow stakeholders to perform self-service deep dives.

Model view

Visualizations

Visualizations Explanation

- **Executive KPI Pulse:** Provides an immediate snapshot of business health through high-level metrics including Churn Rate (6.8%), Average Products per Customer, Monthly New Acquisitions (2K), and ARPU (\$10.77K).
- **Behavioral Cohort Analysis:** The central matrix tracks the lifecycle of monthly user groups, visualizing exactly how many customers remain active over a 12-month period to identify long-term loyalty trends.
- **Segmented Engagement Trends:** The bottom line chart monitors Monthly Active Users (MAU) across Basic, Enterprise, and Professional tiers, revealing specific periods of engagement fluctuation for targeted intervention.
- **Churn Velocity by Tier:** The area chart analyzes churn rates relative to the customer lifecycle (Month Index), helping the business understand which service tiers are most susceptible to attrition at different stages.
- **Dynamic Granularity:** Includes deep-dive filters for Region, Acquisition Channel, and Service Tier, allowing users to pivot the entire analysis to find high-performing segments or "leaky" acquisition sources.

Customer Cohort Retention

Cohort Grouping: grouped the users by Cohort Month (the month they joined), which is the standard "All Customers" view.

Retention Tracking: The horizontal axis (0–20) tracks the lifecycle of those customers, showing exactly how many remain active over time.

Visual Proof of Loyalty: The matrix demonstrates how "sticky" the services are. For instance, seeing high numbers in the "15–20" month range proves long-term retention.

Visualizations

- **Segmenting Monthly Active Users (MAU):** It tracks the total count of unique active customers every month, fulfilling the requirement for "Monthly Active Users" metrics.
- **Comparing Performance by Tier:** It breaks down engagement across Basic, Professional, and Enterprise tiers, allowing NFX to see which service levels are most stable or volatile.
- **Identifying Engagement Trends:** Pinpoints usage dips, such as the early 2023 Enterprise fluctuation, to address specific inconsistencies..

Visualizations

Visualizations Explanation

- **Onboarding Efficiency:** The Days to First Action line chart identifies the speed of user engagement, revealing the critical window between a customer signing up and performing their first service.
- **Acquisition Seasonality:** The Monthly New Acquisition bar chart highlights a significant peak in January, followed by a steady decline, pinpointing the most effective months for new user growth.
- **Strategic Growth Pivot:** The dual-axis trend chart shows that while new acquisitions have flattened, Reactivation Events spiked in 2024, indicating growth is now driven by winning back former users.
- **High-Value Loyalty:** The Engagement Bucket donut chart proves long-term stability, with 75.9% (7.59K) of the base classified as "Power Users" (active for 10+ months).
- **KPI Command Center:** The executive scorecard provides immediate visibility into high-level health metrics, including 10K Reactivated Customers and the total Active Customer count.

Visualizations

Monthly New Acquisition by Month

Count of customer_id by Engagement Bucket

New customer per month

- **Acquisition Volume:** Displays unique monthly signups, peaking at nearly **300 acquisitions** in January.
- **Performance Seasonality:** Shows high success in Q1, followed by a steady decline in volume throughout the rest of the year.
- **Strategic Baseline:** Provides "Top of the Funnel" data to compare against churn and reactivation as acquisition slows.

Engagement Buckets

- **High-Value Retention:** Shows **75.94%** of the base are "Power Users" (10+ months tenure).
- **Platform Stickiness:** Confirms NFX successfully retains the vast majority of users post-onboarding.
- **Behavioral Segments:** Clearly differentiates "Regular" (5-9 months) from long-term "Power Users."

Visualizations

Count of customer_id by Days to First Action

Time to First Action and Reactivation Events

Onboarding Velocity: The "Time to First Action" chart in shows most users engage immediately after signup.

Retention Triggers: Rapid "Speed to Value" helps NFX secure the "aha moment," significantly reducing early-stage churn.

Strategic Growth Shift: 2024 growth is primarily fueled by "winning back" former users rather than new signups.

Reactivation Success: The spike in reactivated customers proves the high long-term value of the existing database and effective win-back campaigns.

Visualizations

Visualizations Explanation

- **Executive Revenue Health:** Records 108.0M Total Revenue with steady year-over-year growth from 2022 to 2024.
- **Retention Analysis:** Tracks loyalty over 35 months across tiers to pinpoint where customer drops occur.
- **Global Revenue Map:** Uses a treemap to identify top-profit markets like Australia, Singapore, and the USA by service tier.
- **Customer Segmentation:** Shows a balanced base with roughly 33% distribution across Small, Medium, and Large customers.
- **Acquisition Tracking:** Monitors growth via 10K New Customers and 10K Monthly Acquisitions to guide scaling.

Visualizations

Retention % by Month Index and service_tier

Customer Size

- Equal Split:** All three segments (Small, Medium, Large) each hold roughly 33% of the base.
- Versatility:** The equal distribution proves the product scales effectively for any business size.
- Risk Mitigation:** A balanced portfolio prevents over-reliance on a single customer type.

Retention Curve

- Tier Gaps:** Professional users stay the longest, Basic users drop off the fastest.
- Day 1 Critical:** The steepest churn happens immediately after signup (Month 0).
- Long-term Stability:** Retention flattens over time, showing that tenured users become highly loyal.

Count of customer_id by customer_size

Visualizations

Tot Revenue by Year

● Increase ● Decrease ● Total

Tot Revenue by region and service_tier

Revenue Profile

Steady Growth Velocity: The waterfall chart shows a consistent year-over-year increase in total revenue from 2022 through 2024.

Total Revenue Milestone: Cumulative revenue has reached a peak of approximately \$0.1bn by the end of 2024.

Regional Market Leaders: The treemap identifies Australia and UAE as major revenue contributors based on their visual share.

Diverse Service Tiers: Revenue is diversified across Enterprise, Professional, and Basic tiers within every major region.

Global Footprint: The business maintains strong revenue streams across six key international markets, including the USA, India, Singapore, and the UK.

Key Findings & Potential Solutions

Key Findings	Potential Solutions
Revenue & Growth Pivot: While total revenue has steadily climbed to \$108.0M, 2024 growth is primarily driven by reactivating former users rather than finding new ones, as new acquisitions have flattened..	Targeted Basic-Tier Engagement: Implement a specialized "Success Program" for Basic-tier users to bridge the retention gap and mirror the loyalty seen in the Professional tier
High-Value Retention: NFX has a remarkably "sticky" platform once users settle in; 75.94% of the base are "Power Users" with over 10 months of tenure..	First-Month Onboarding Optimization: Since the sharpest decline happens at Month 0, NFX should automate "Aha Moment" prompts immediately following the "Time to First Action" to secure early commitment.
Tiered Loyalty Gaps: The Professional tier shows the strongest retention over a 35-month cycle, whereas the Basic tier experiences the fastest and most significant drop-off.	Double Down on Reactivation: Given the 2024 success in winning back users, NFX should invest more in automated re-engagement campaigns targeting the "lost" segments in the database
Critical Onboarding Window: Most customers take their first action almost immediately after signup, but the steepest churn occurs within the first 30 days (Month 0 to Month 1).	Monetize Power User Loyalty: With 7.59K Power Users, there is a significant opportunity for upselling or referral programs to leverage this highly stable and satisfied segment
Balanced Market Reach: The customer base is perfectly diversified, with an almost equal 33% split between Small, Medium, and Large organizations.	Seasonal Acquisition Re-calibration: Since new acquisitions peak in January and taper off, marketing spend should be shifted to Q1 to maximize ROI during high-intent months.
